EE19B138\_4.sh x

```
1 #!/bin/bash
2
3 #Usage: Open your linux terminal and enter the command: bash EE19B138_4.sh
4 #Note: All the files will be created in the PWD.
5
6 echo "" > plot2.txt
7 echo "" > plot3.txt
8 echo "" > plot4.txt      #Files created and initialised to store the data to be plotted
9
10 gcc EE19B138_4.c -lm -o plot #Executable of the .c file is created
11
12 #Note:
13 #In all the places, the stepsize is in the order of 1e-17 or 1e-18 because the derivative of Phi is in the order of 1e16. So choosing a stepsize
14 # in the order of 1e-12 or 1e-13 leads to an increase of 1000 in Phi for every iteration which contradicts the meaning of the SMALL increment.
15 #Theoretically, stepsize must be infinitesimally small and all calculations are done with that limit operating. But since, it is not possible in a computer,
16 # I chose it as 1e-18 so the Phi increment would be in the order of 0.01 radians which is comparable to the range in which Phi is.
17
18 ./plot 0.5e-17 0.05 1 > plot1.txt      #Data generated for part 1 of the assignment
19
20 for i in {1..1000}
21 do
22     var="${i}e-18"
23     ./plot $var 0.05 2 >> plot2.txt    #Data generated for part 2 of the assignment
24 done
25
